

# APBF-DEC Lubricants Project

Presented by:  
Shawn D. Whitacre, NREL

Presented at:  
4<sup>th</sup> JCAP Conference  
Tokyo, Japan  
June 1, 2005

# APBF-DEC Participants

## Government

- DOE
- NREL
- ORNL
- EPA
- CARB
- SCAQMD

## Automobile

- Ford
- GM
- DaimlerChrysler
- Toyota

## Technology

- Battelle

## Engines

- EMA
- Caterpillar
- Detroit Diesel
- Cummins
- John Deere
- Mack Trucks
- International Truck & Engine

## Emission Control

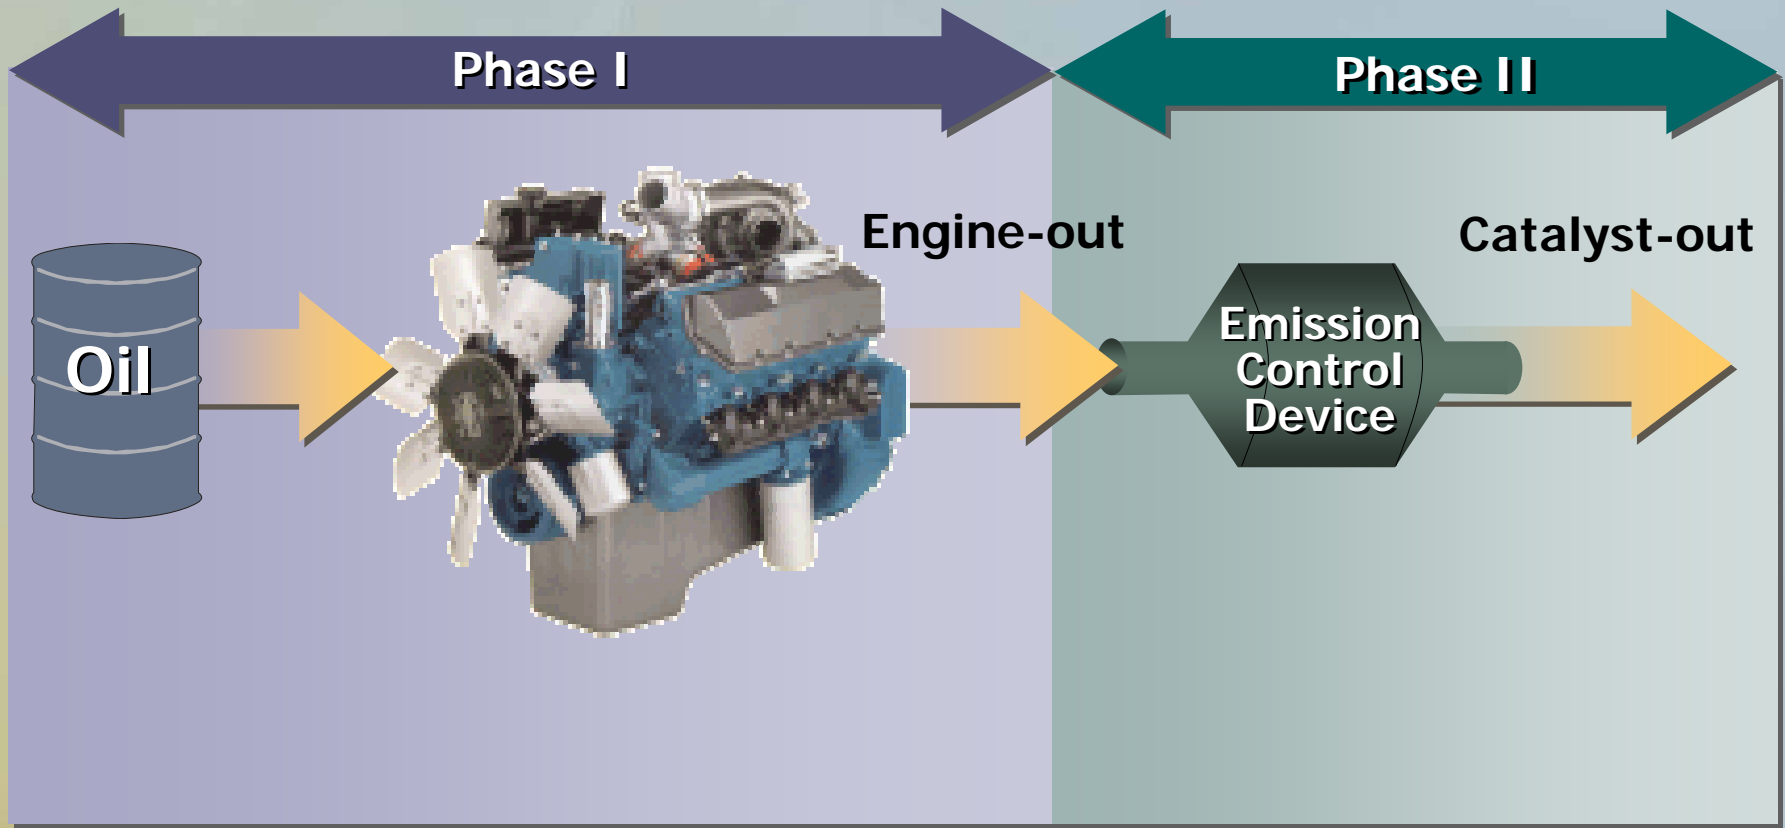

- MECA • Johnson Matthey
- Delphi • 3M • Engelhard
- Siemens • Benteler • ArvinMeritor
- Clean Diesel Tech. • Corning
- Donaldson Co. • OMG
- NGK • Rhodia • Argillon
- Tenneco Automotive • Robert Bosch

## Energy/Additives

- API • American Chemistry Council
- BP • Castrol • ChevronOronite
- Chevron • Ciba • Ergon
- Afton • ExxonMobil • Infineum
- Lubrizol • Marathon Ashland
- Motiva • NPRA
- Pennzoil-Quaker State
- Shell Global Solutions • Valvoline
- ConocoPhillips • Crompton

# Two-Phase Approach

# Objectives

## Phase I

Determine the impact of lubricant properties and composition on engine-out/catalyst-in emissions

- Part 1: Characterize effects of lubricant properties on engine out emissions
- Part 2: Develop methods to accelerate exposures of emission control systems (ECS) to lubricant-derived emissions

## Phase II

Determine if lubricant formulation impacts the performance and durability of diesel engine ECS

# Desired Outcome

- ▶ Determine which (if any) lube derived emission components are detrimental to ECS performance and durability

## The results will provide:

### Guidelines for lubricant formulation

- Basestock selection
- Additive chemistry

### Design guidelines

- Engine manufacturers
- ECS suppliers

# Phase 1

# Lubricant Selection Phase 1 Base Oils

- ▶ Group I: Valero (Paulsboro)
  - 4800-5600-ppm S, 75% saturates
- ▶ Group II: Excel (Lake Charles)
  - <20-ppm S, >99% saturates
- ▶ Group III: Motiva (Port Arthur, TX)
  - <5-ppm S, >99% saturates
- ▶ Group IV: BP
  - PAO (poly-alpha olefin, synthetic)
  - 0 sulfur
  - 5% ester for additive solubility (from Uniqema)

# Lubricant Selection Additive Packages

Five suppliers (Ciba, Chevron, Ethyl, Infineum, and Lubrizol) provided specifications on 26 candidate additive packages

Range of constituents (in Group II base oil)

Ash	0 – 1.85%
Sulfur	0 – 6590-ppm
Calcium	0 – 4770-ppm
Zinc	0 – 1900-ppm
Phosphorus	0 – 1700-ppm
Magnesium	0 – 1700-ppm
Boron	0 – 1235-ppm

Supplier and source of constituents not specified

# Test Laboratory – Phase I

- ▶ Subcontractor: Automotive Testing Laboratories, (East Liberty, OH)

Phase I - Part 1

# Test Engine

## ▶ 1999 International T444E

- 7.3L OHV V-8
- Direct injection, turbocharged w/ wastegate
- HEUI fuel system
- 215 hp at 2400 rpm
- 540 ft-lbs torque at 1500 rpm
- Exhaust gas recirculation (retrofit)
- Closed crankcase ventilation with filter
- Lube system capacity: 18 quarts

# Test Modes and Emissions Measurements

## Four Mode Steady-State (OICA)

- Mode 1: Rated Condition
- Mode 2: High Torque
- Mode 3: Road Load
- Mode 4: Low Torque

## Emissions Measurements

- Gases (HC, CO, CO<sub>2</sub>, NO<sub>x</sub>, SO<sub>2</sub>)
- PM – three sampling trains
  - TPM, SOF, SO<sub>4</sub>
  - Metals
  - PAHs

# Data Analysis Questions #1 and #2

1

Are there significant differences in engine-out emissions that can be attributed to oil properties?

2

If so, how much of an impact is due to properties of the additive package? ... base oil?

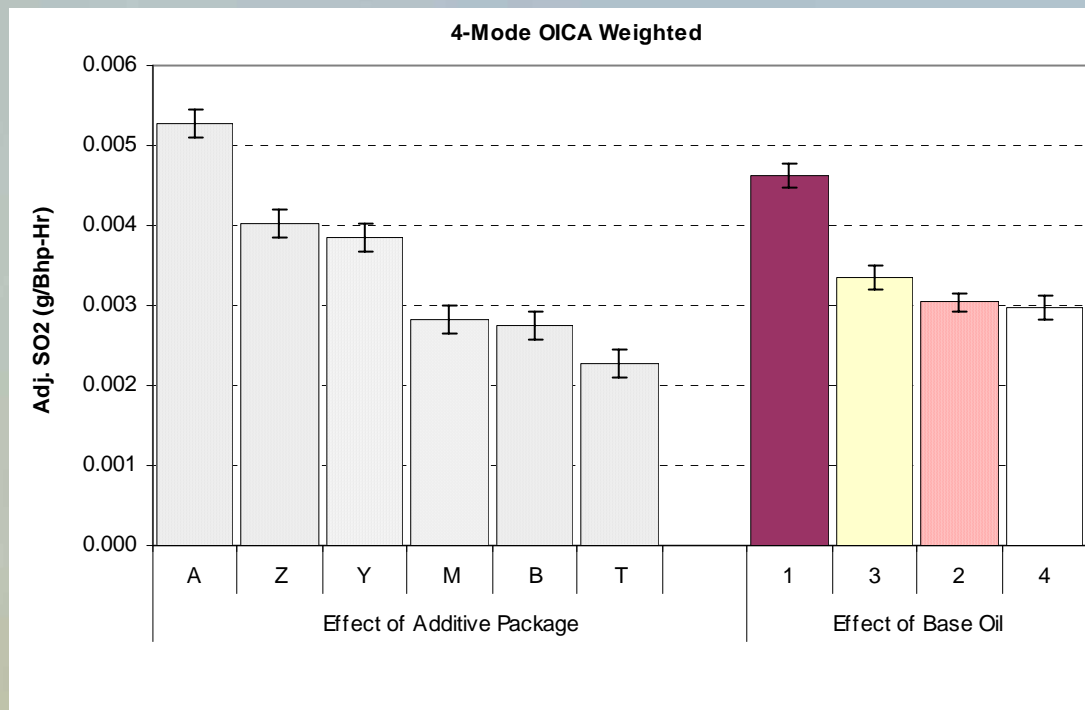

- ▶ Magnitude of the effects do not directly correlate with sulfur content of oil

# Also... Significant Effects of Additive Packages and Base Oils on SO<sub>2</sub>

## Main Effects of Additives and Base Oils

- ▶ Many significant differences among the 6 additive packages tested in all four base oils
- ▶ Significant base oil effect – Group 1 highest
- ▶ No significant interactions between additive packages and base oils

# Data Analysis Question #3

3

Which emissions species can be directly predicted from the properties of the oil and fuel?

# Mass Balance

**PM  
Emissions**

- Metals
- $\text{SO}_4$

**Gaseous  
Emissions**

- $\text{SO}_2$

- Emissions from fuel and oil consumptions and wear metals
- Recovery rates obtained by comparing measured emissions with calculated values based on fuel and oil properties

Phase I - Part 1

# Ca Mass Balance

- ▶ Ca emissions directly correlated with concentration in oil
- ▶ No apparent composition effects
- ▶ 42% recovery rate

Phase I - Part 1

# P Mass Balance

- ▶ P emissions directly correlated with concentration in oil
- ▶ Oil c2, c3 and c4 deviate significantly
- ▶ 86% recovery rate (excl. Oils c2, c3 and c4)

# Sulfur Mass Balance (continued)

▶ S emissions directly correlated with concentration in oil

▶ Oil i significantly deviates

▶ 125% recovery rate (excl. Oils i)

# Phase I Conclusions

- ▶ Lubricant formulation has modest effects on regulated emissions
  - $\pm 10\%$  for CO and NO<sub>x</sub>,  $\pm 20\%$  for PM, and  $\pm 30\%$  for HC
- ▶ Sulfur content in the oil has significant effects on sulfur emissions.
- ▶ However, oil formulation (beyond oil sulfur content) can have a significant impact on SO<sub>2</sub> emissions (e.g. oils c and i)
- ▶ Metals (S, P, Zn, Ca) emissions correlate with concentration in oil

# Phase 2

# Test Laboratory – Phase 2

- ▶ Subcontractor: Analytical Engineering, Inc. (AEI)  
Columbus, Indiana

Phase I - Part 1

# Test Hardware – Phase 2

- 2002 Cummins ISB – 300 hp @ 2500 rpm
- 5.9L, inline 6 cylinder
- Cooled-EGR
- Single NOx adsorber (7L)
- In-pipe regeneration fueling

# Test Protocol

- ▶ 400-hour test
- ▶ Evaluations at 100-hour intervals
  - Focus on NO<sub>x</sub> reduction efficiency
- ▶ Oil consumption measurement
- ▶ New LNT for each test
- ▶ Oil change at 200-hours
- ▶ DEC base fuel (0.6-ppm S/15-ppm S)
- ▶ Post-analysis of catalyst by XRF

# Operating Modes

Mode	Engine Speed (RPM)	Load (FT*Lbs)	Average Catalyst Mid Temp. °F (°C)	Space Velocity (1/hr)
1	1650	140	650 (343)	30,000
2	2100	175	650 (343)	70,000
3	1400	160	750 (399)	32,000
4	1900	225	750 (399)	63,000
5	1200	275	850 (454)	33,000
6	1700	350	850 (454)	62,000

# Phase 2 Analysis Approach

# Test Matrix

# Properties of Test Oils

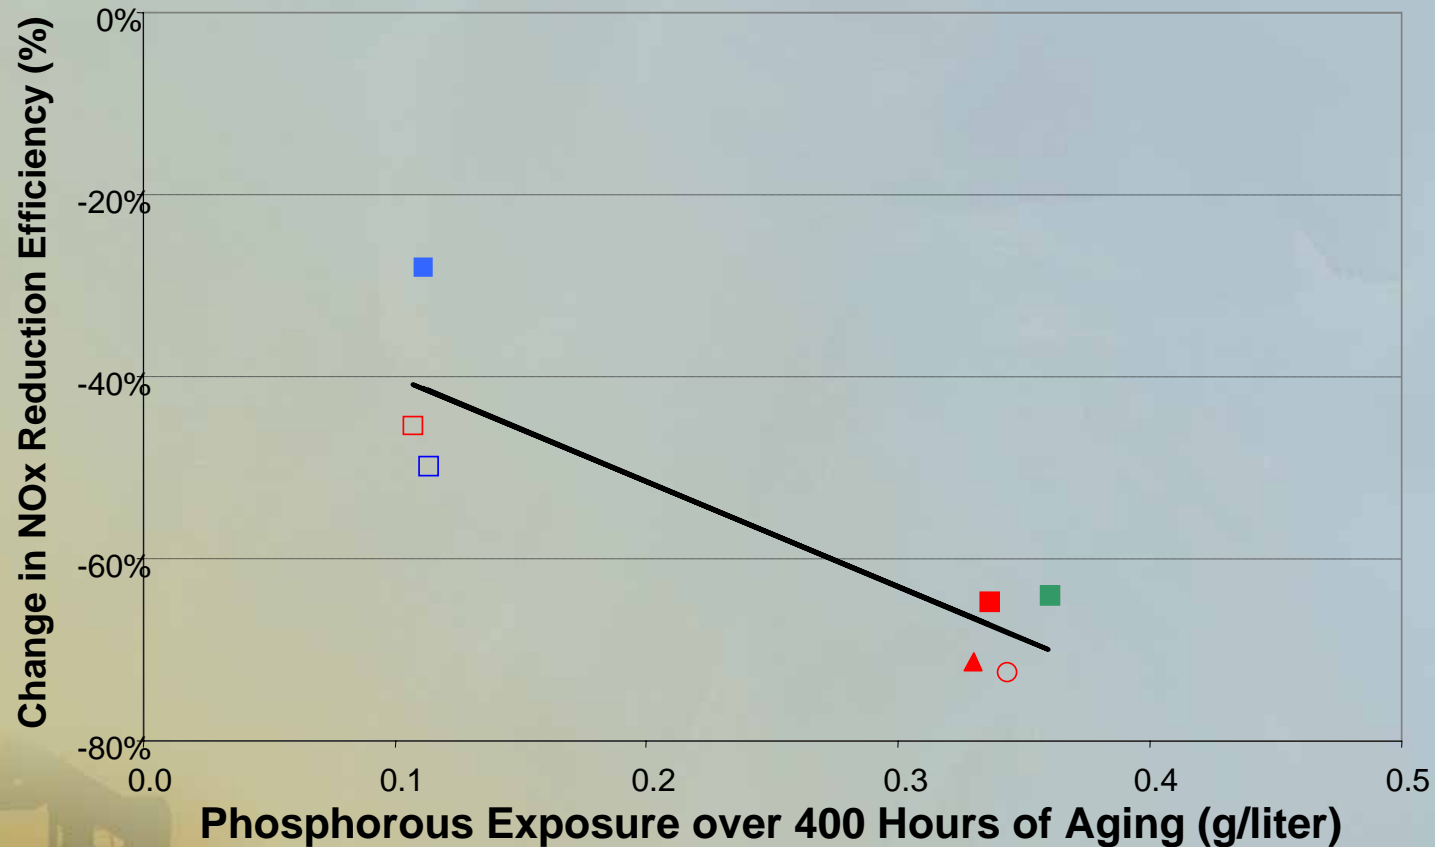

Test Number	Ash* (%)	S* (ppm)	Ca (ppm)	P (ppm)	Zn (ppm)	N* (ppm)	TBN (mg KOH/g)	Viscosity		Soot (%)
								@100°C (cSt)	@40° C (cSt)	
1	0.775	1695	1853	427	471	1128	6.99	14.9	111.3	0.07
2	1.522	2928	3258	1210	1320	1329	12.34	15.0	111.9	0.06
3	1.131	3980	2050	1430	1590	1477	7.3	15.0	111.9	0.06
4	1.316	4195	3160	1340	1520	1314	10.6	15.0	112.5	0.12
5	1.310	2228	3241	419	475	1368	9.6	14.6	107.7	0.12

7	0.775	1695	2065	451	505	1128	6.7	14.9	110.9	0.08
8	0.775	1695	2329	483	546	1128	8.7	14.9	110.9	0.11

# Catalyst Deposit Profile

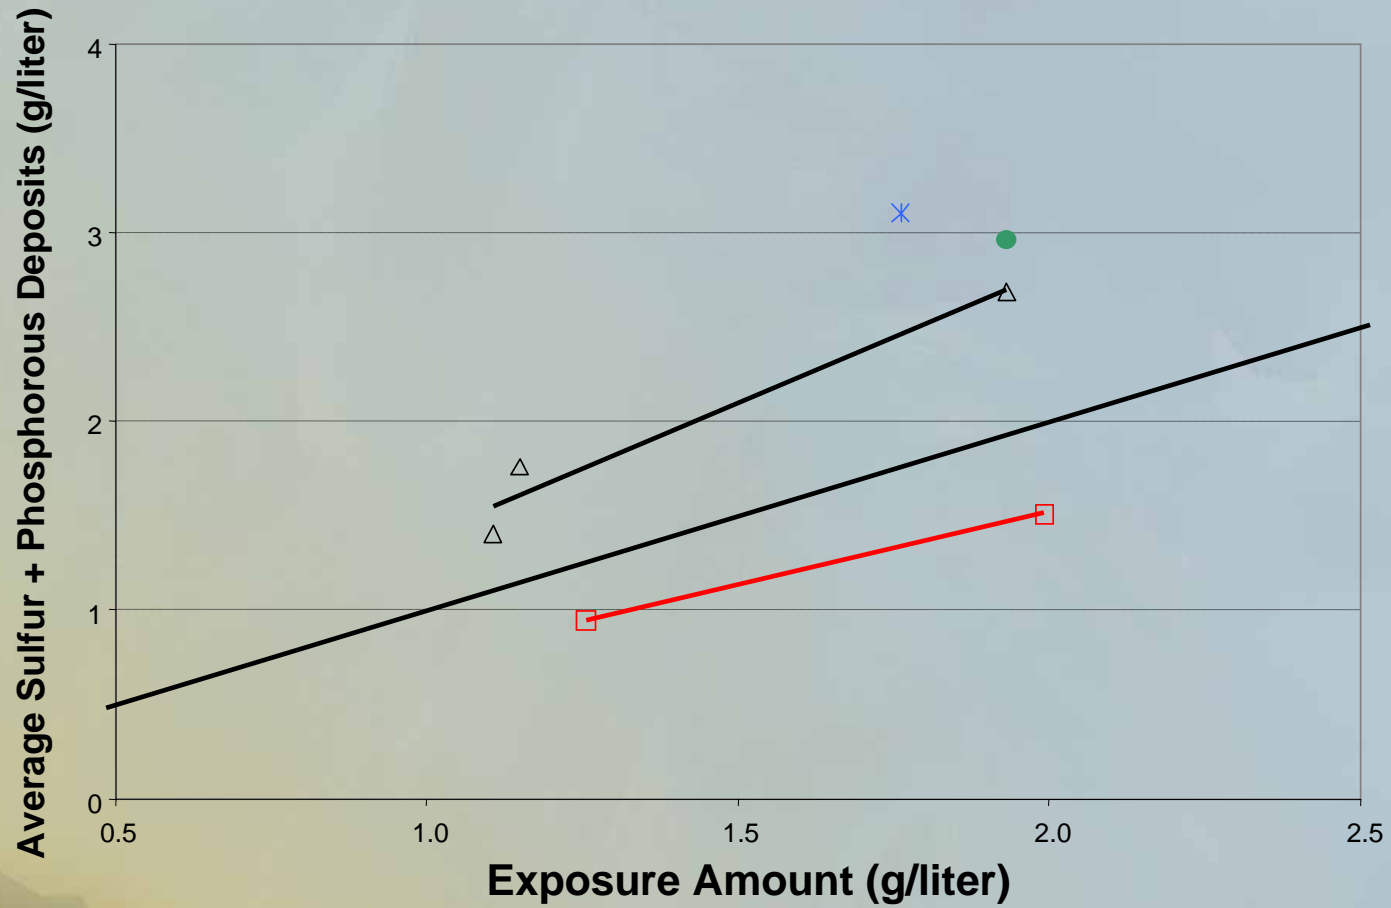

# Phosphorus Impact on Performance

Lubricant-Test Number: A-1 A-7 B-3 E-2 F-4 C-5 D-6

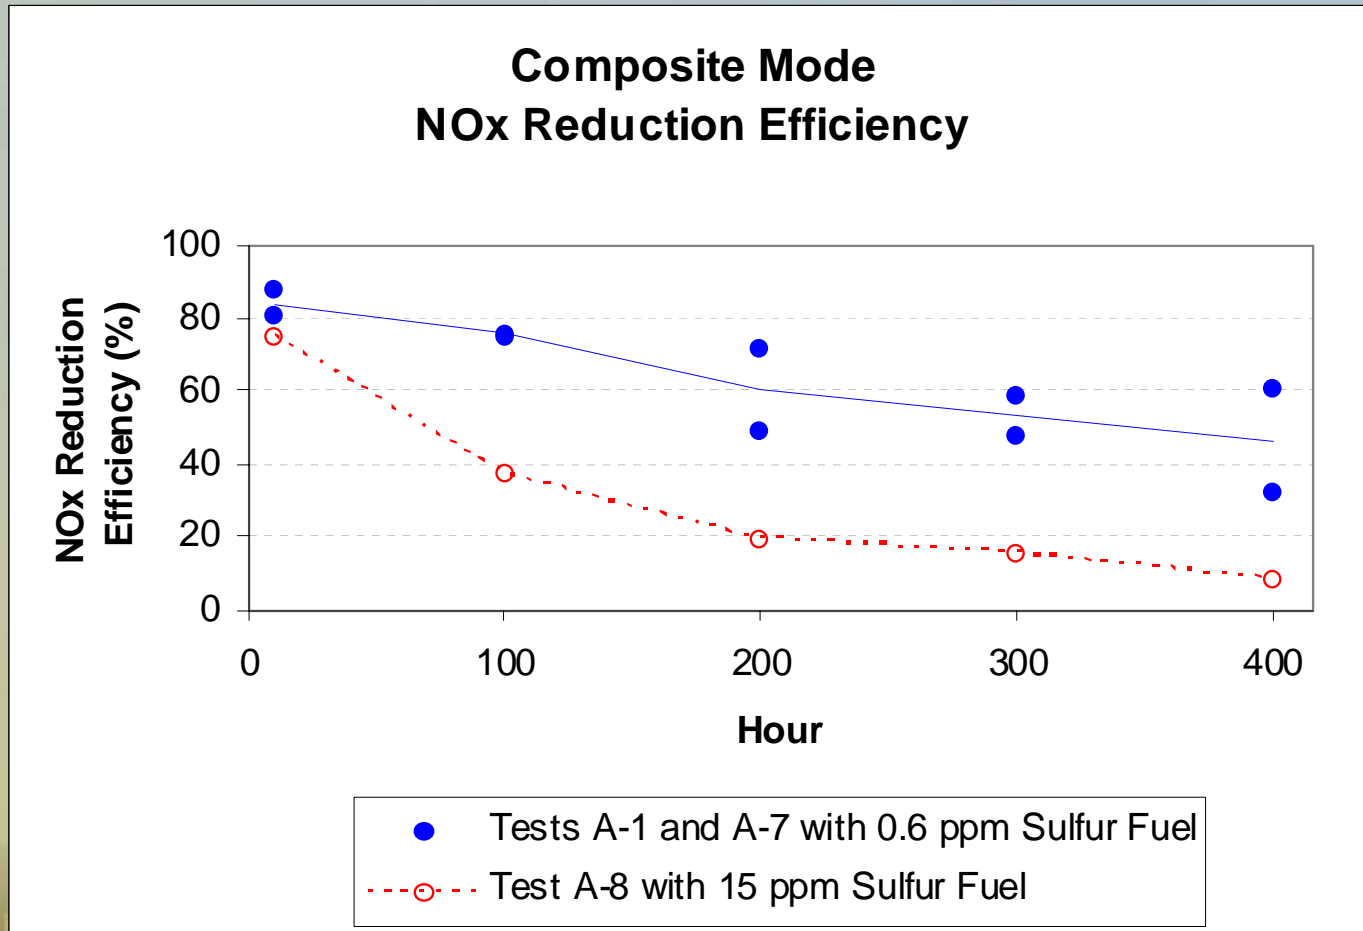

# Impact of Detergent

△ Low Ca Sulfonate   □ High Ca Sulfonate   ● High Ca Phenate   \* High Ca Salicylate

# Relative Impact of Fuel and Lube S

# Preliminary Conclusions – Phase 2

- Final reporting still in progress
  - Will be available late 2005
- Sulfur and phosphorus in lube oil appear to impact LNT performance
- Deposits of lube oil derived species concentrated on front of catalyst
- Detergent level may temper the effect
- Fuel sulfur still appears to be dominant in terms of degradation

# THE END
